

Conclusion

This project successfully demonstrated the use of SQL to analyze pizza sales data and extract meaningful business insights. By applying SQL concepts such as joins, aggregate functions, subqueries, and window functions, key performance metrics including total revenue, customer ordering patterns, popular pizza types, category-wise sales, and revenue trends were identified.

The analysis highlights how SQL can transform raw transactional data into valuable information that supports data-driven decision-making. Overall, this project strengthened my SQL skills and showcased the practical application of database querying techniques in solving real-world business problems.
